Unit 3: Costs of Production and Perfect Competition

Production and the Law of Diminishing Marginal Returns*

Calculate MP. Plot TP and MP on Graph		
Number of Workers	Total Product	Marginal Product
0	0	
1	5	
2	15	
3	19	
4	20	
5	20	
6	18	

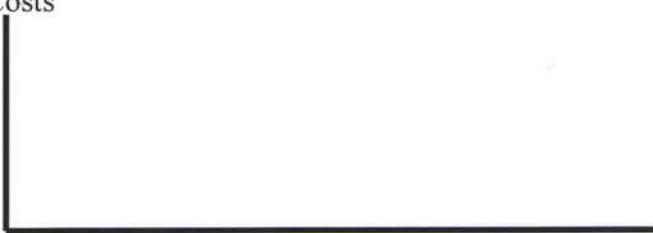

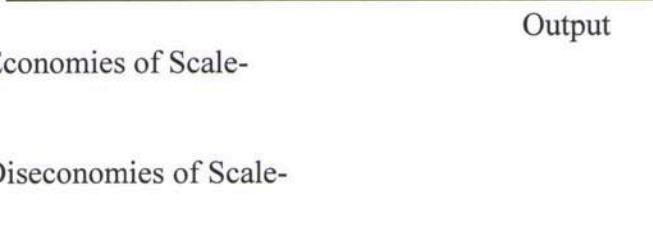

Define the Law of Diminishing Marginal Returns

After which worker does diminishing marginal returns set in?

Identify the three stages of returns: increasing, decreasing, and negative marginal returns

Revenue and Costs* (Define the following)

Total Revenue-	Fixed Cost (FC)-
Accounting Profit-	Variable Cost (VC)-
Economic Profit-	Total Cost (TC)-
Normal Profit-	Marginal Cost (MC)-

Short Run Cost Curves* (at least one fixed resource)	Long-Run Cost Curves (all resources are variable)
Draw and Label ATC, AVC, and MC Costs 	Costs  Economies of Scale- Diseconomies of Scale-

Name: _____

Team: _____

Calculating ATC, AVC, AFC, and MC

Fill in the blanks for a firm producing boxes of oranges :

Output (box)	Variable Cost	Total Cost	AVC	AFC	ATC	MC
0	\$0	\$10	-	-	-	-
1	20					
2	30					
3	60		3.33	23.3		
4	100		2.5	27.5		

Assume this firm is in a perfectly competitive market and the price is \$35 for each box.

1. How many boxes should they produce? Why?

2. Calculate the profit at that quantity

Shut Down Point*

Shut Down Rule:

1. A per unit tax shifts _____ so quantity will _____.

Short-Run Supply Curve:

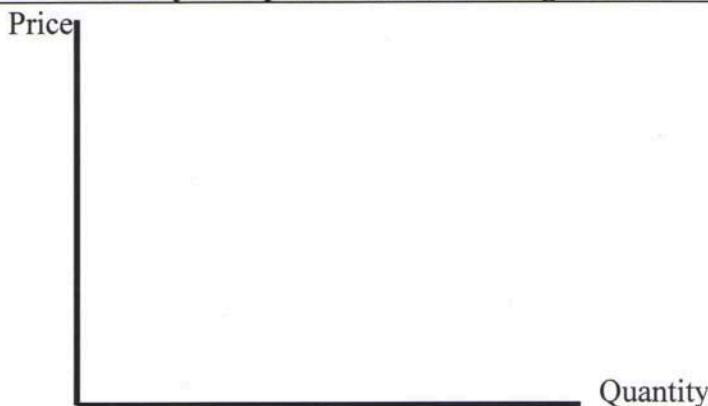

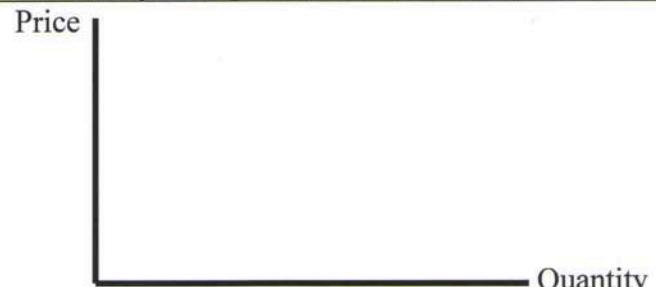

2. A lump sum tax shifts _____ so quantity will _____.

Graphing Perfect Competition*

Draw side-by-side graphs showing a perfectly competitive market and firm. Draw the firm making short-run profit

List (in order) what will happen in the long-run

Market
P ____ Q ____
Firm
P ____ Q ____

Perfectly Competitive Firm Making a Loss**Perfectly Competitive Firm in Long-Run***

This firm has both type of efficiency:

- 1.
- 2.

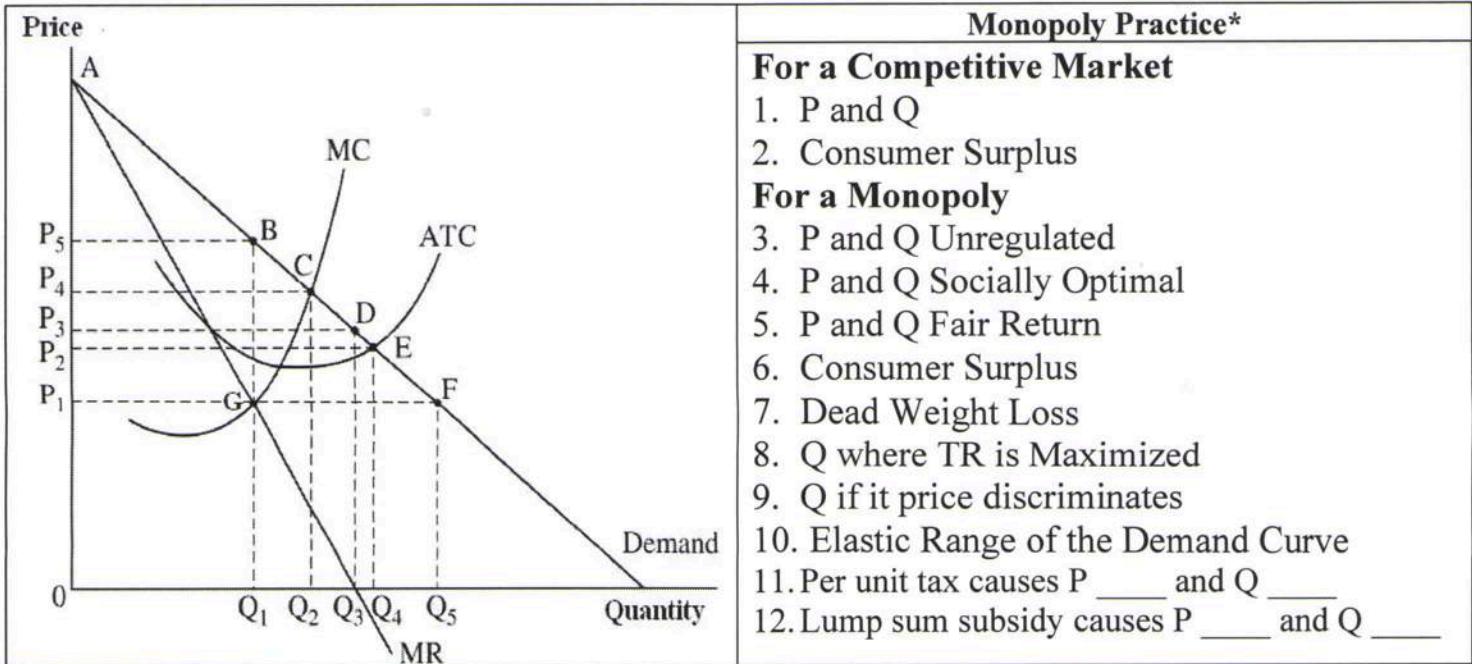

Name: _____
Team: _____

Unit 4: Imperfect Competition

Characteristics of the Four Market Structures

Perfect Competition	Monopolistic Competition	Oligopoly	Monopoly
Demand and Marginal Revenue*			
Why is demand greater than marginal revenue for all imperfectly competitive firms?		Elastic and Inelastic Range*	
Why are monopolies inefficient? 1. 2. 3.		<p>A blank coordinate system with a vertical axis labeled "Price" and a horizontal axis labeled "Quantity".</p>	
Monopoly Graph (profit)* Draw and label a Monopoly making profit		<p>A blank coordinate system with a vertical axis labeled "Price" and a horizontal axis labeled "Quantity".</p>	
Monopoly Graph (loss) Draw and label a Monopoly making profit		Price Discriminating Monopoly* Draw and label a price discriminating monopoly	
<p>A blank coordinate system with a vertical axis labeled "Price" and a horizontal axis labeled "Quantity".</p>		<p>A blank coordinate system with a vertical axis labeled "Price" and a horizontal axis labeled "Quantity".</p>	

Name: _____
 Team: _____

Monopolistic Competition*

Draw a Mono. Comp. firm in long-run equilibrium

Excess Capacity (define below and label on graph)

If a monopolistically competitive firm is making a profit in the short-run, what will happen to the demand and number of firms in the long run?

Quantity

Oligopoly

1. If David decides to advertise now and Lindsey decides to do it later, what is David's expected profit?
2. What is Lindsey's dominant strategy?
3. What is David's dominant strategy?
4. If both owners have the information but do not actively collude, what will be the outcome?

Assume the advertising company offers a deal that increases the profit for both owners by \$2,000 but only if they advertise later. Based on these changes:

5. What is Lindsey's dominant strategy?
6. What is David's dominant strategy?

Assume that two business owners are deciding between advertising now and advertising later. The chart shows expected profit with Lindsey's on the left

		David	
		Now	Later
Lindsey	Now	\$5,000, \$4,000	\$3,000, \$3,500
	Later	\$900, \$1,000	\$1,500, \$1,800

Unit 6: Four Market Failures

Public Goods	Monopolies
Why are public goods a market failure? Two Characteristic of Public Goods: 1. Nonexclusion- 2. Shared consumption- Maximizing Rule for Public Goods:	Label monopoly unregulated, socially optimal, and fair return
Negative Externalities	Positive Externalities
Draw a negative externality	Draw a positive externality
Solution:	Solution:
Distribution of Income and Taxes	Tax Incidence
1. Progressive Tax- 2. Proportional Tax- 3. Regressive Tax- Who pays more of the tax: 4. If demand is elastic and supply is inelastic? 5. If demand is inelastic and supply is elastic? 6. If demand is perfectly inelastic?	Label the amount consumers and producers pay of tax 

Unit 1: Basic Economics Concepts

Key Terms (Define the following)

1. Scarcity

Individuals, businesses, and Governments have unlimited wants but limited resources.

2. Positive vs. Normative Economics

Positive refers to facts. No opinions

Normative includes opinion. "What out to be done".

3. Trade-offs

ALL the possible options given up when you make a choice

4. Opportunity Cost

The ONE best option given up when you make a choice including the money, time, and forgone opportunities.

3 Economic Systems

1. Centrally Planned Economies (Communism)

Economic system where the government owns the resources and decides what to make, how to make it, and who gets it. Total government control of the economy

2. Free-Market Economies (Capitalism)

Economic system where individual citizens own the resources and decides what to make, how to make it, and who gets it. Little or no government involvement in the economy

3. Mixed Economies

Almost all economies are a mixture of the above systems.

Production Possibilities Curve (Frontier)*

Use the chart to create a PPC to the right.

	A	B	C	D	E
Hats	0	1	2	3	4
Shoes	30	29	25	15	0

Label the following three points on the graph:

X= Unemployment/Inefficiency

Y= Efficient

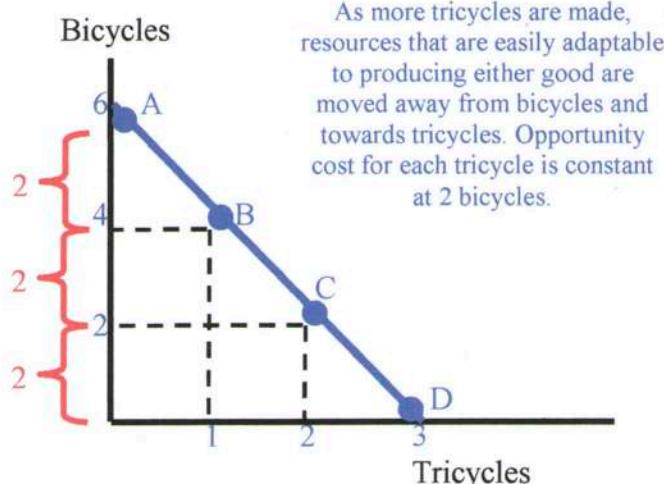

Z= Impossible given current resource

Constant Opportunity Cost*

Why does this occur? Resources are easily adaptable between both products.

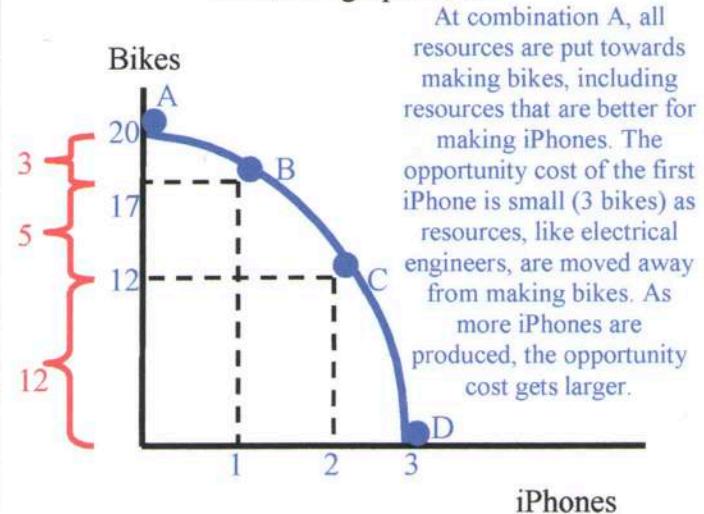

Draw the graph below

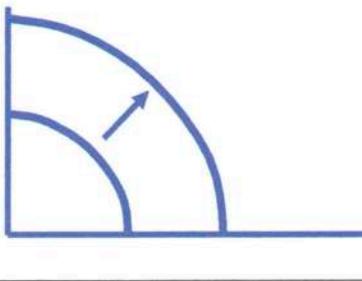

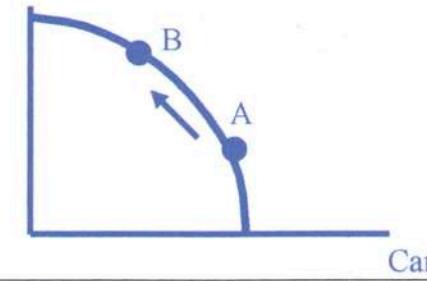

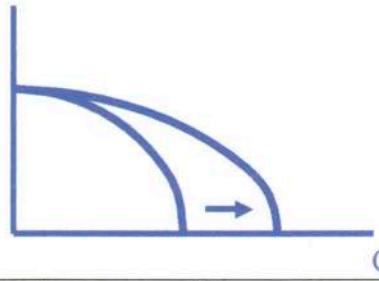

Increasing Opportunity Cost*

Why does this occur? Resources are not easily adaptable between both products

Draw the graph below

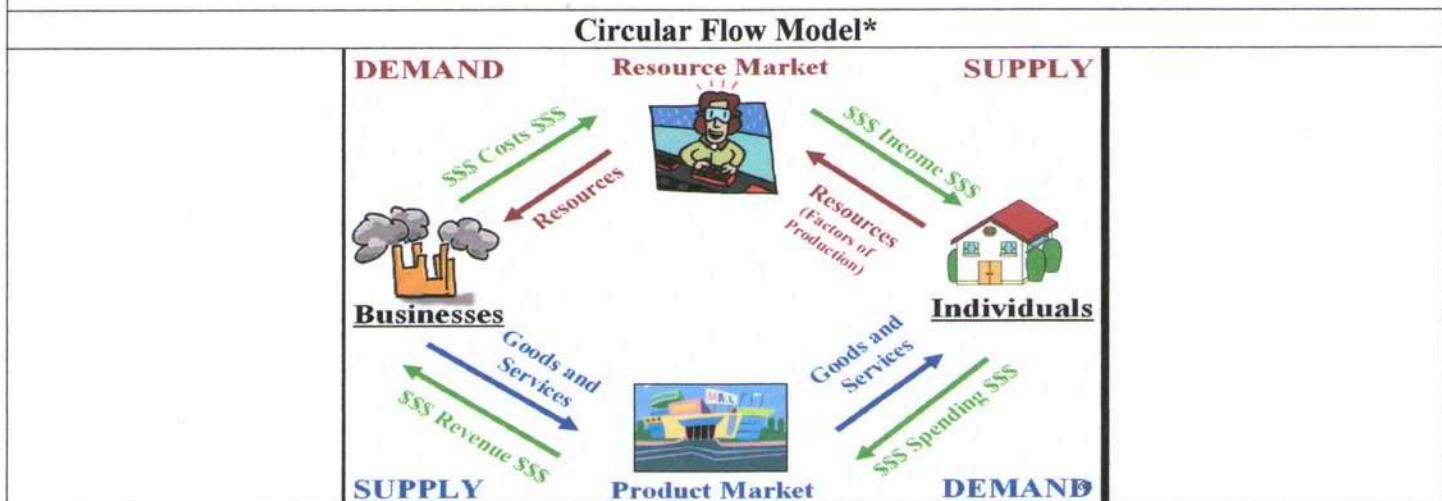

*See videos on YouTube channel ACDCLeadership

Efficiency	Shifting the PPC	
<p>Difference between allocative and productive efficiency:</p> <p><u>Productive Efficiency</u>- Products are being produced in the least costly way (any point ON the curve)</p> <p><u>Allocative Efficiency</u>- The products being produced are the ones most desired by society. (<i>optimal</i> point depends on the desires of society.)</p>	<p>Identify the three shifters of the PPC</p> <ol style="list-style-type: none"> 1. Change in resource quantity or quality 2. Change in Technology 3. Change in Trade 	
Shifting and Changes Practice (draw 3 PPCs with pizza and cars)		
<p>Scenario: Better resources for both products</p> 	<p>Scenario: Increase in consumer demand for pizza</p> 	<p>Scenario: Improvements in technology for only cars</p> 
Trade: Absolute and Comparative Advantage*		

	Sugar (tons)	Cars
Cuba	40 (1S costs $\frac{1}{4}$ Car)	10 (1C costs 4 Sugar)
Mexico	50 (1S costs 2 Cars)	100 (1C costs $\frac{1}{2}$ Sugar)

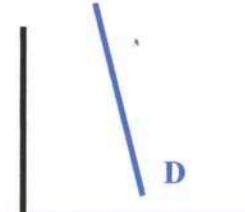

1. Which country has an absolute advantage in sugar? Mexico
2. Which country has an absolute advantage in cars? Mexico
3. What is Cuba's opportunity cost for producing one car? 4 Sugar
4. Which country has a comparative advantage in cars? Mexico
5. Which country has a comparative advantage in sugar? Cuba
6. For both countries to benefit from trade, how much sugar can be traded for each car? 1 Car for 1 Sugar (any number between 4 and $\frac{1}{2}$)

Unit 3: Costs of Production and Perfect Competition

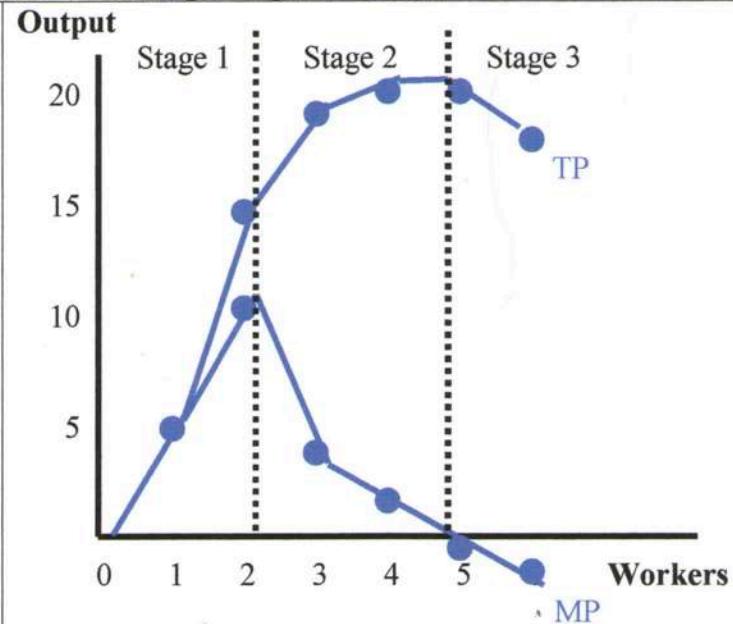

Production and the Law of Diminishing Marginal Returns*

Calculate MP. Plot TP and MP on Graph

Number of Workers	Total Product	Marginal Product
0	0	-
1	5	5
2	15	10
3	19	4
4	20	1
5	20	0
6	18	-2

Define the Law of Diminishing Marginal Returns
As variable resources are added to fixed resources, the additional output from each new worker will eventually fall.

After which worker does diminishing marginal returns set in? After the 2nd Worker

Identify the three stages of returns: increasing, decreasing, and negative marginal returns

Revenue and Costs* (Define the following)

Total Revenue-

$$\text{Price} \times \text{Quantity}$$

Accounting Profit-

$$\text{Total Revenue} - \text{Explicit Costs}$$

Economic Profit-

$$\text{Total Revenue} - \text{Explicit and Implicit Costs}$$

Normal Profit-

Zero Economic Profit (breaking even)

Fixed Cost (FC)- Costs that DON'T change as you produce more (ex: rent, insurance, etc.)

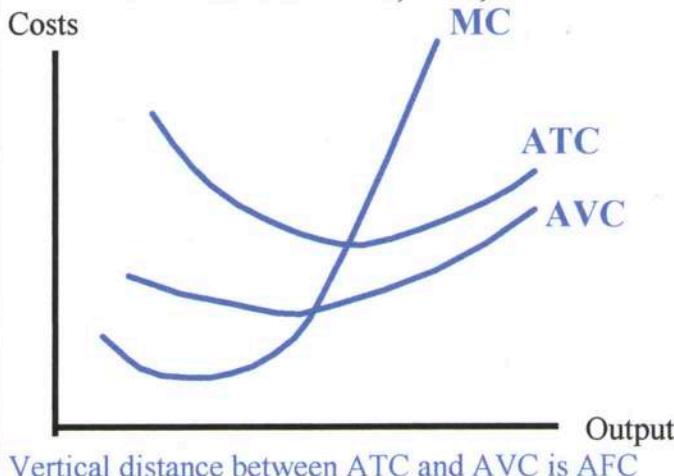

Variable Cost (VC)- Costs that DO change as you produce more (wages to workers, raw materials, etc.)

Total Cost (TC)- Fixed Costs + Variable Costs

Marginal Cost (MC)- Additional cost to produce one additional output.

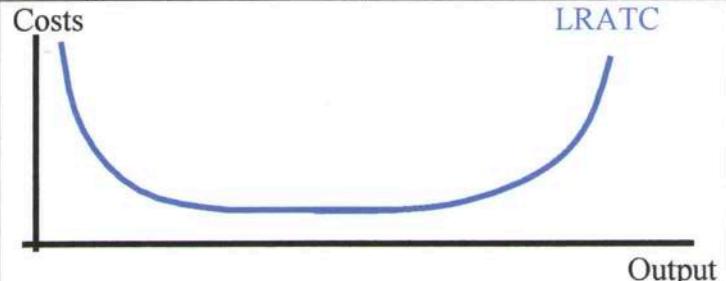

Short Run Cost Curves* (at least one fixed resource)

Draw and Label ATC, AVC, and MC

Vertical distance between ATC and AVC is AFC

Long-Run Cost Curves (all resources are variable)

Economies of Scale- Long run average total cost (LRATC) falls because mass production techniques are used.

Diseconomies of Scale- Long run average total cost (LRATC) increase as the firm gets too big and difficult to manage.

Calculating ATC, AVC, AFC, and MC

Fill in the blanks for a firm producing boxes of oranges :

Output (box)	Variable Cost	Total Cost	AVC	AFC	ATC	MC
0	\$0	\$10	-	-	-	-
1	20	\$30	\$20	\$10	\$30	\$20
2	30	\$40	\$15	\$5	\$20	\$10
3	60	\$70	\$20	\$3.3	\$23	\$30
4	100	\$110	\$25	\$2.5	\$27	\$40

Assume this firm is in a perfectly competitive market and the price is \$35 for each box.

- How many boxes should they produce? Why? 3 Boxes of Oranges, Firms should produce as long as the additional revenue of a unit is greater than the additional cost. To maximize profit, produce where $MR = MC$
- Calculate the profit at that quantity
 $TR = \$105$ and $TC = \$70$,
 $\text{Profit} = \$35$

Shut Down Point*

Shut Down Rule: A firm should shut down if the price fall below the minimum AVC

Short-Run Supply Curve: The MC curve above minimum AVC

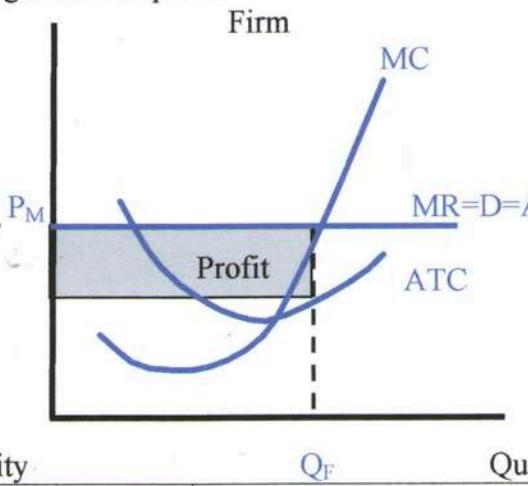

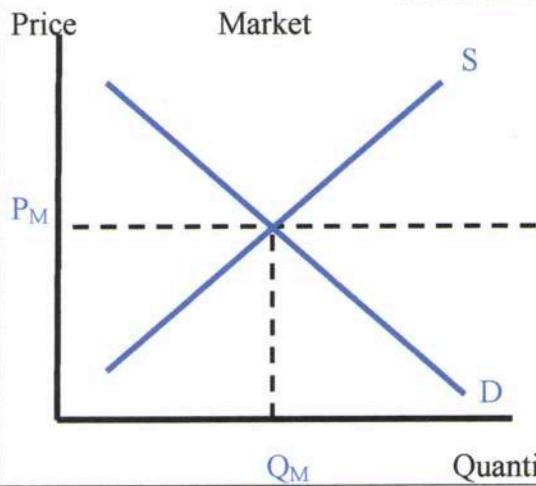

Per-Unit vs. Lump-Sum*

1. A per unit tax shifts MC, AVC, and ATC so quantity will Change (decrease).

2. A lump sum tax shifts AFC and ATC so quantity will NOT change.

Graphing Perfect Competition*

Draw side-by-side graphs showing a perfectly competitive market and firm. Draw the firm making short-run profit

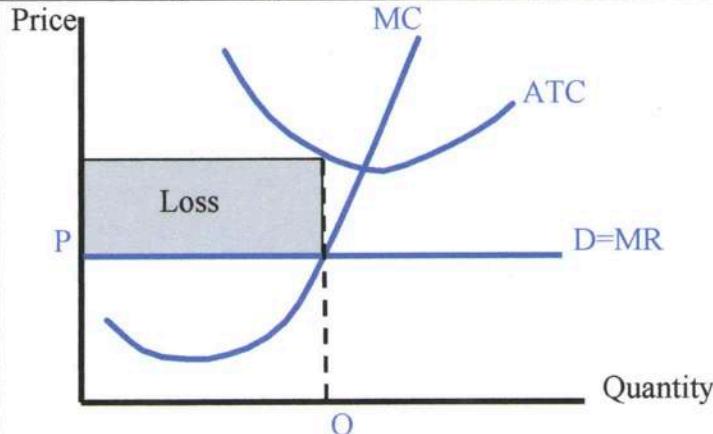

List (in order) what will happen in the long-run

- More firms will enter to get profit
- The market supply will increase (shift right)

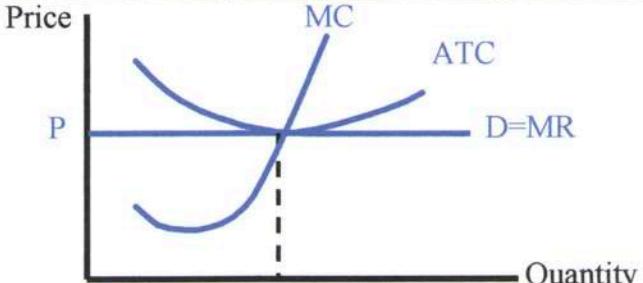

Market
 $P \downarrow \quad Q \uparrow$

Firm
 $P \downarrow \quad Q \downarrow$

Perfectly Competitive Firm Making a Loss

Perfectly Competitive Firm in Long-Run*

This firm has both types of efficiency:

- Productive Efficiency: Minimum ATC
- Allocative Efficiency: Price = MC

Unit 4: Imperfect Competition

Characteristics of the Four Market Structures

Perfect Competition

- Many small firms
- Identical products
- Easy to enter and exit
- No need to advertise
- Firms are “Price Takers”

Monopolistic Competition

- Large number of sellers
- Differentiated products
- Easy to enter and exit
- A lot of non-price competition
- Some control over price

Oligopoly

- A Few Large Firms (Less than 10)
- High Barriers
- Control Over Price
- Mutual Interdependence

Monopoly

- One firm
- Unique product
- High barriers to enter and exit
- Price Maker

Demand and Marginal Revenue*

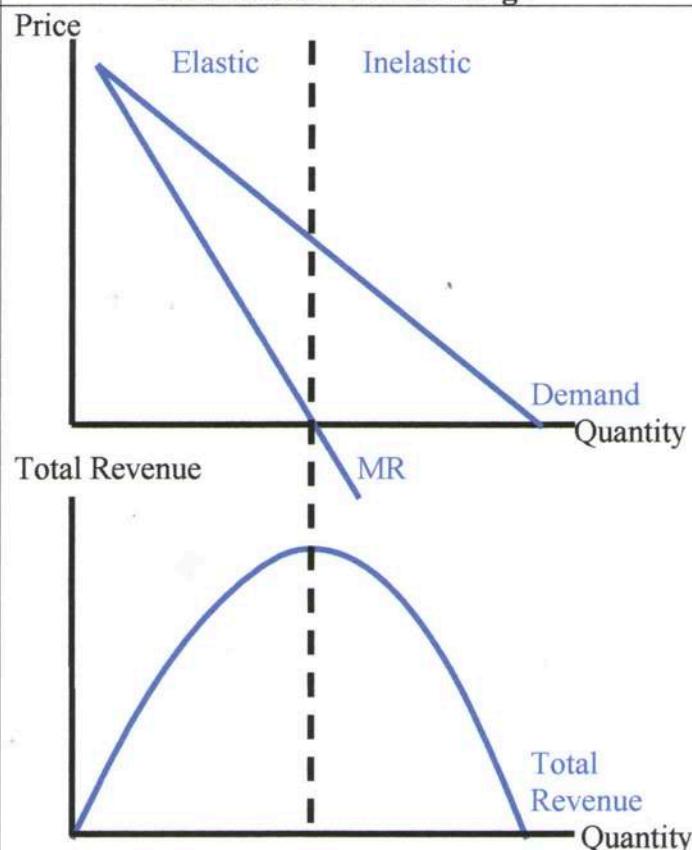

Why is demand greater than marginal revenue for all imperfectly competitive firms?

To sell another unit, the firm must lower the price of the next unit and the units it could have sold at a higher price. (It cannot price discriminate)

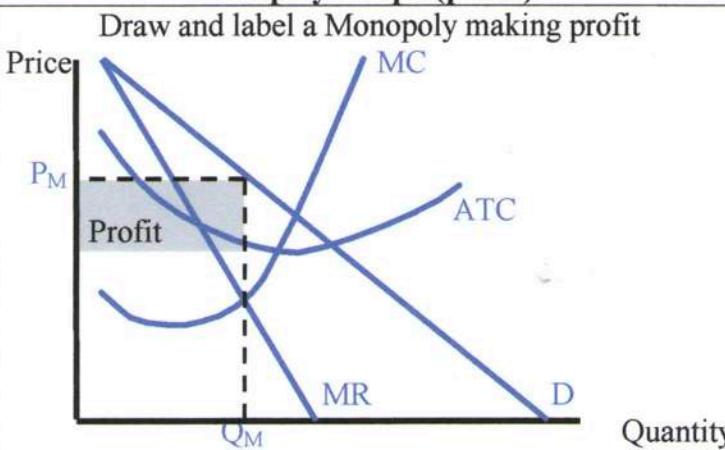

Why are monopolies inefficient?

1. Price is too high
2. Quantity is too low
3. Inefficient (Dead Weight Loss)

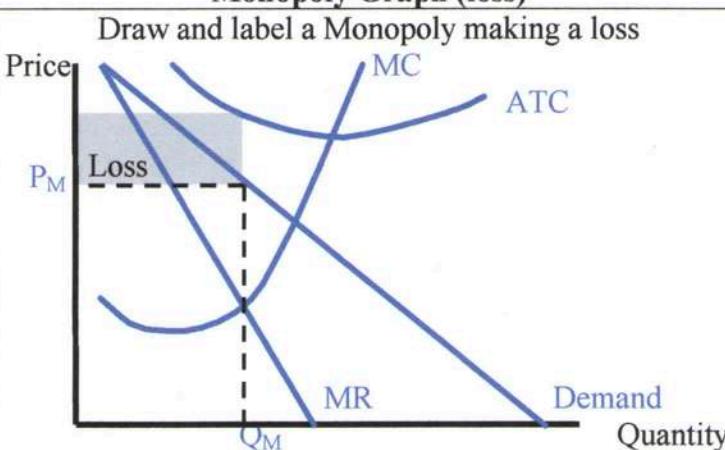

Elastic and Inelastic Range*

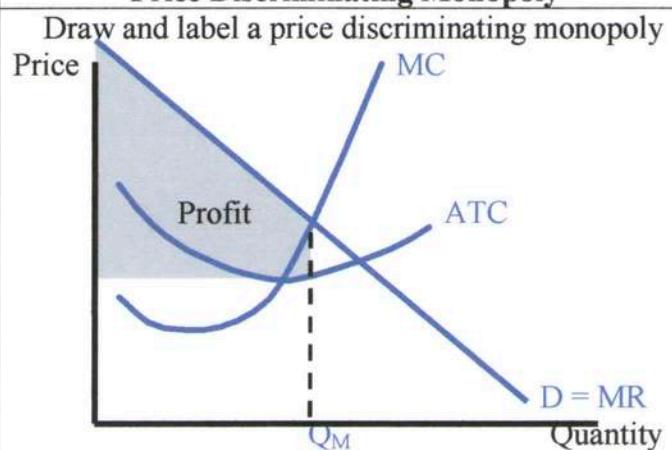

Monopoly Graph (profit)*

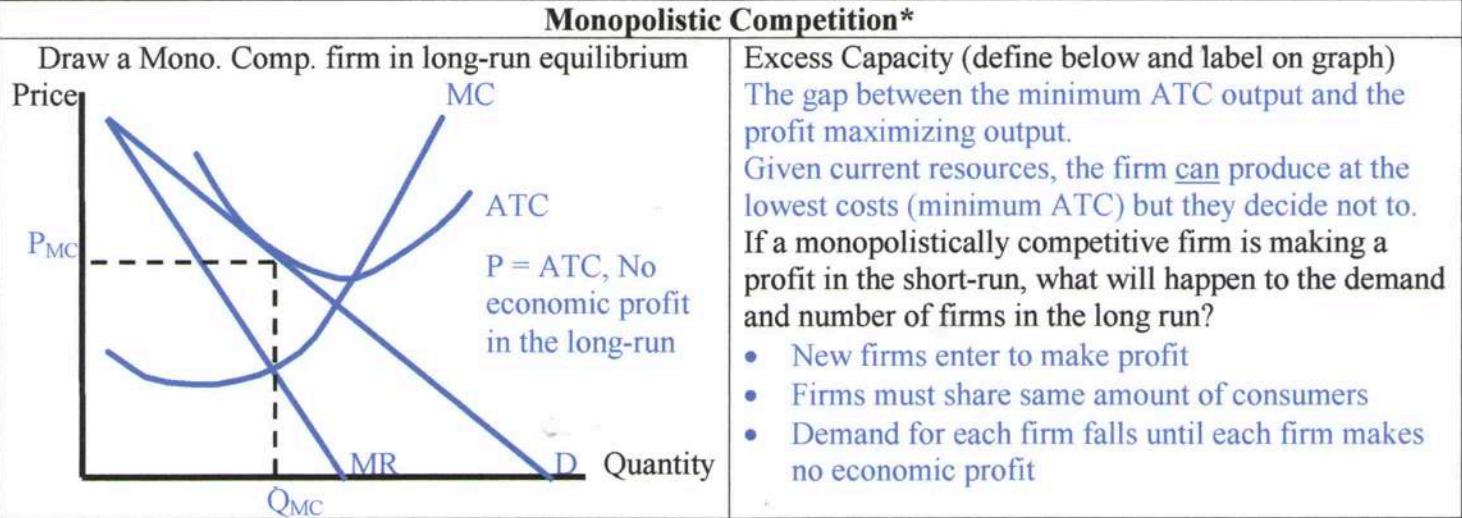

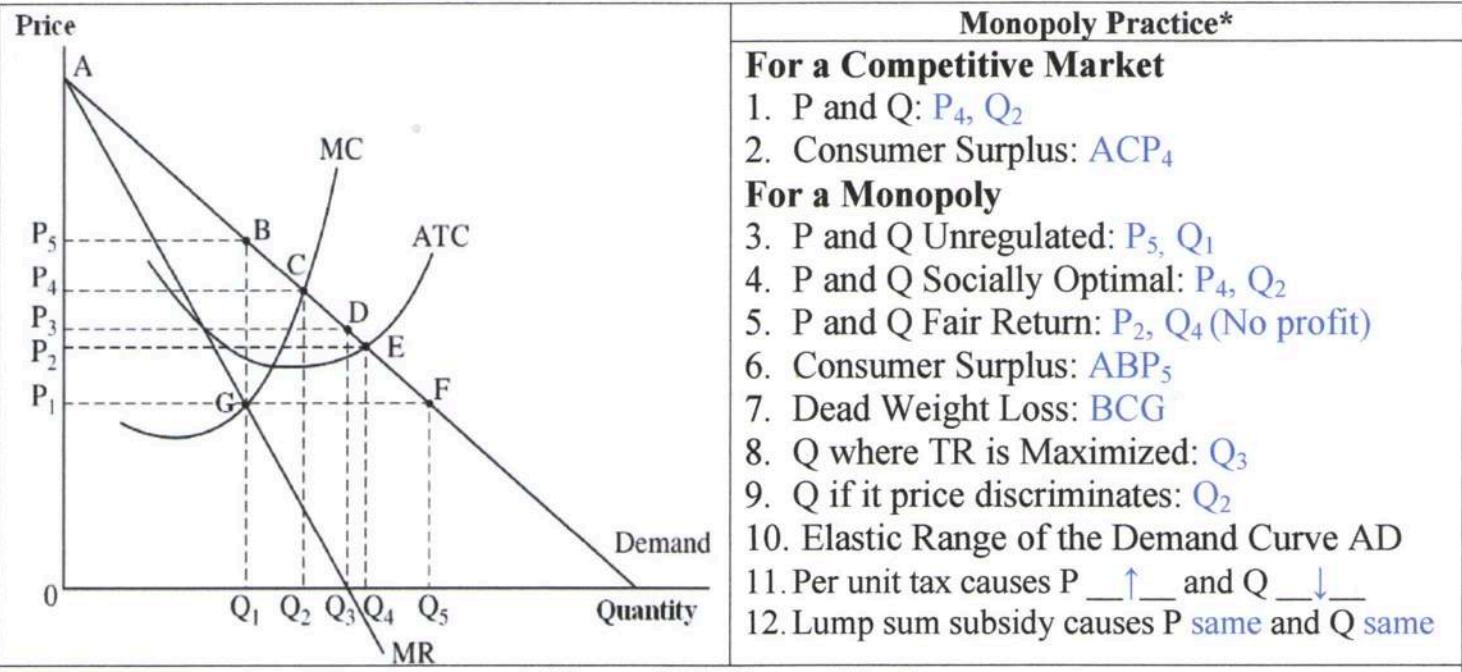

Monopoly Graph (loss)

Price Discriminating Monopoly*

Oligopoly

<ol style="list-style-type: none"> 1. If David decides to advertise now and Lindsey decides to do it later, what is David's expected profit? $\\$1000$ 2. What is Lindsey's dominant strategy? <u>Now</u> 3. What is David's dominant strategy? <u>None</u> 4. Unit 6: Four Market Failures

Public Goods	Monopolies*
<p>Why are public goods a market failure? It is impractical for the free-market to provide these goods because there is little opportunity to earn profit.</p> <p>Two Characteristic of Public Goods:</p> <ol style="list-style-type: none"> 1. Nonexclusion-Cannot exclude benefits of the good. Everyone can use the good, even those that don't pay. 2. Shared consumption-One person's consumption of a good does not reduce the usefulness to others. <p>Maximizing Rule for Public Goods: Public goods should be produced as long as the additional benefit to society is greater than the additional cost. Produce where $MSB = MSC$</p>	<p>Label monopoly unregulated, socially optimal, and fair return</p> <p>A graph illustrating market failure due to monopoly power. The vertical axis is Price and the horizontal axis is Quantity. It shows four curves: Marginal Cost (MC), Average Total Cost (ATC), Marginal Revenue (MR), and Demand (D). The intersection of MC and ATC determines the unregulated output level at point A. The intersection of MR and D determines the socially optimal output level at point B. The intersection of MC and D determines the fair return output level at point C. The dead weight loss is represented by the shaded triangle between points A and C.</p> <p>A = Unregulated B = Soc. Optimal C = Fair Return</p>
Negative Externalities*	Positive Externalities*
<p>Draw a negative externality</p> <p>A graph illustrating negative externalities. The vertical axis is Price and the horizontal axis is Quantity. It shows three downward-sloping demand curves: D=MSB (most elastic), D=MPB (middle), and S=MPC (steepest). The intersection of S=MPC and D=MSB determines the free market quantity at Q_{Free Market}. The intersection of S=MPC and D=MPB determines the optimal quantity at Q_{Optimal}. The dead weight loss is represented by the shaded triangle between Q_{Free Market} and Q_{Optimal}.</p> <p>Dead Weight Loss</p> <p>Firms ignore the social cost and produce at their marginal private cost (MPC)</p> <p>Q_{Optimal} Q_{Free Market} Quantity</p> <p>Solution: Per unit tax so $MPC = MSC$</p>	<p>Draw a positive externality</p> <p>A graph illustrating positive externalities. The vertical axis is Price and the horizontal axis is Quantity. It shows three upward-sloping supply curves: S=MSC (steepest), S=MPB (middle), and D=MSB (most elastic). The intersection of S=MSC and D=MSB determines the free market quantity at Q_{Free Market}. The intersection of S=MPB and D=MSB determines the optimal quantity at Q_{Optimal}. The dead weight loss is represented by the shaded triangle between Q_{Free Market} and Q_{Optimal}.</p> <p>Dead Weight Loss</p> <p>Consumers ignore the social benefits and demand only their marginal private benefit (MPB)</p> <p>Q_{Free Market} Q_{Optimal} Quantity</p> <p>Solution: Per unit subsidy so $MPB = MSB$</p>
Distribution of Income and Taxes	Tax Incidence*
<ol style="list-style-type: none"> 1. Progressive Tax- takes a larger percent of income from high income groups (takes more from rich people). 2. Proportional Tax- takes the same percent of income from all income groups. 3. Regressive Tax- takes a larger percentage from low income groups (takes more from poor people). <p>Who pays more of the tax:</p> <ol style="list-style-type: none"> 4. If demand is elastic and supply is inelastic? Producers 5. If demand is inelastic and supply is elastic? Consumers 6. If demand is perfectly inelastic? Consumers pay all of the tax 	<p>Label the amount consumers and producers pay of tax</p> <p>A graph illustrating tax incidence. The vertical axis is Price and the horizontal axis is Quantity. It shows two intersecting curves: Supply (S) and Demand (D). A horizontal dashed line at price P₁ intersects the demand curve at a quantity Q₁. A horizontal dashed line at price P intersects the supply curve at a quantity Q. The area between P and P₁ up to Q₁ is shaded horizontally and labeled "Consumer's portion of tax". The area between P and P up to Q is shaded vertically and labeled "Producer's portion of tax".</p> <p>Price</p> <p>P₁</p> <p>P</p> <p>S_{Tax}</p> <p>S</p> <p>D</p> <p>Consumer's portion of tax</p> <p>Producer's portion of tax</p> <p>Quantity</p>

Key Terms	Balance of Payments
Export-	Balance of Payments-
Import-	Current Account-
Net Exports (X_N)-	Example:
Trade Deficit-	Capital Account-
Trade Surplus-	Example:
Foreign Exchange (FOREX)	FOREX Shifters
<u>Appreciation</u> - The US dollar will appreciate relative to another currency if demand for the dollar _____ or if supply _____. This will cause US exports to _____ and imports to _____.	1. 2. 3. 4.
<u>Depreciation</u> - The US dollar will depreciate relative to another currency if demand for the dollar _____ or if supply _____. This will cause US exports to _____ and imports to _____.	
Foreign Exchange Market	Appreciation and Depreciation
Draw the foreign exchange market for Mexican Pesos. Show what happens to the value of pesos relative to the US dollar if interest rates in Mexico are higher	<ol style="list-style-type: none"> If American tourists increase visits to Japan, the supply of US dollars will _____ and the demand for Japanese yen will _____. The dollar will _____ and the yen will _____. If the US government significantly decreases personal income taxes, the dollar will _____ and the yen will _____. If inflation in Japan rises significantly faster than in the US, the dollar will _____ and the yen will _____. If Japan has a large budget deficit that increases Japanese interest rates, the dollar will _____ and the yen will _____. If Japan places high tariffs on all US imports, the dollar will _____ and the yen will _____. The US suffers a larger recession the dollar will _____ and the yen will _____.

Unit 1: Basic Economics Concepts

Key Terms (Define the following)

1. Scarcity

Individuals, businesses, and Governments have unlimited wants but limited resources.

2. Positive vs. Normative Economics

Positive refers to facts. No opinions

Normative includes opinion. "What out to be done".

3. Trade-offs

ALL the possible options given up when you make a choice

4. Opportunity Cost

The ONE best option given up when you make a choice including the money, time, and forgone opportunities.

3 Economic Systems

1. Centrally Planned Economies (Communism)

Economic system where the government owns the resources and decides what to make, how to make it, and who gets it. Total government control of the economy

2. Free-Market Economies (Capitalism)

Economic system where individual citizens own the resources and decides what to make, how to make it, and who gets it. Little or no government involvement in the economy

3. Mixed Economies

Almost all economies are a mixture of the above systems.

Production Possibilities Curve (Frontier)*

Use the chart to create a PPC to the right.

	A	B	C	D	E
Hats	0	1	2	3	4
Shoes	30	29	25	15	0

Label the following three points on the graph:

X= Unemployment/Inefficiency

Y= Efficient

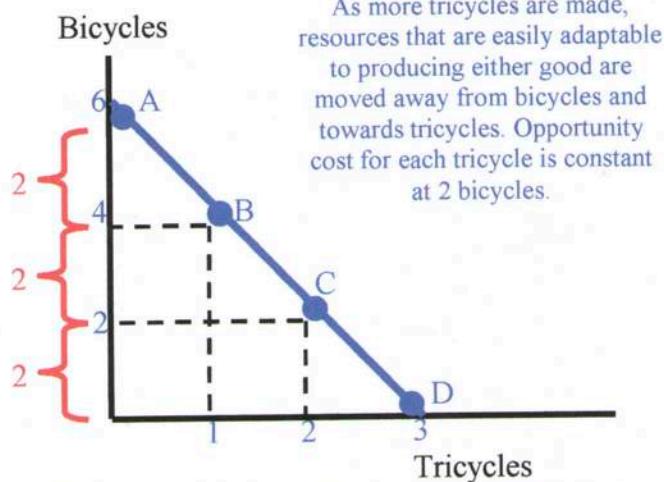

Z= Impossible given current resource

Constant Opportunity Cost*

Why does this occur? Resources are easily adaptable between both products.

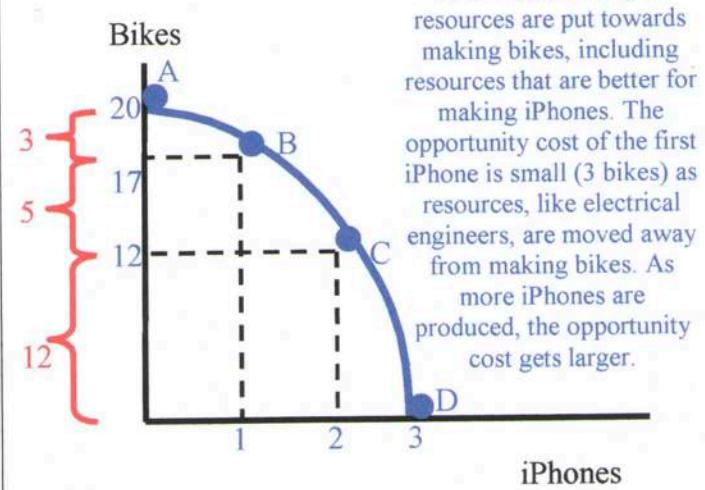

Draw the graph below

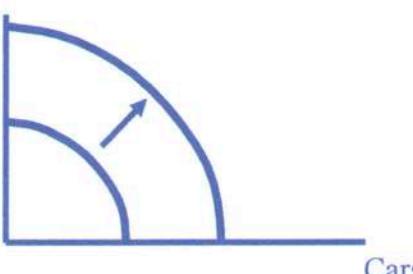

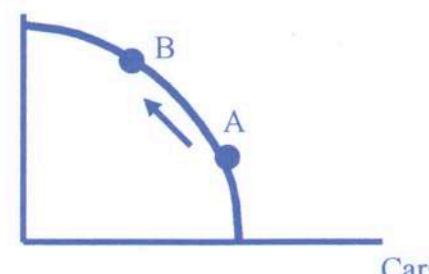

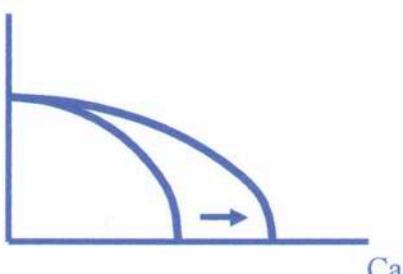

Increasing Opportunity Cost*

Why does this occur? Resources are not easily adaptable between both products

Draw the graph below

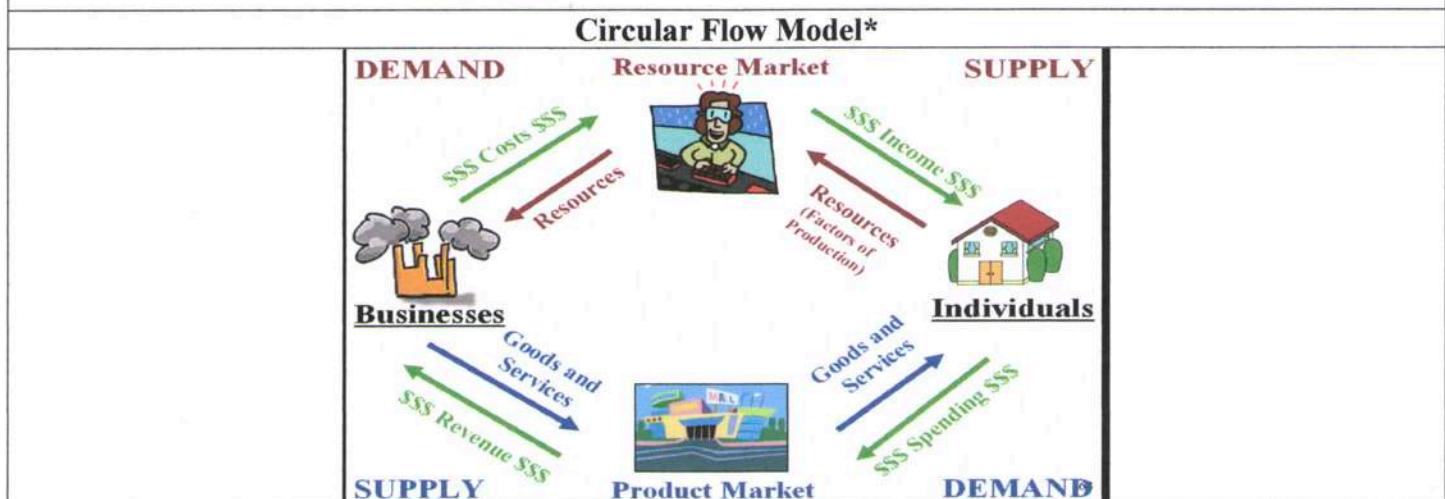

*See videos on YouTube channel ACDCLeadership

Efficiency	Shifting the PPC	
<p>Difference between allocative and productive efficiency:</p> <p><u>Productive Efficiency</u>- Products are being produced in the least costly way (any point ON the curve)</p> <p><u>Allocative Efficiency</u>- The products being produced are the ones most desired by society.(optimal point depends on the desires of society.)</p>	<p>Identify the three shifters of the PPC</p> <ol style="list-style-type: none"> 1. Change in resource quantity or quality 2. Change in Technology 3. Change in Trade 	
Shifting and Changes Practice (draw 3 PPCs with pizza and cars)		
<p>Scenario: Better resources for both products</p>  <p>Pizza</p> <p>Cars</p>	<p>Scenario: Increase in consumer demand for pizza</p>  <p>Pizza</p> <p>Cars</p>	<p>Scenario: Improvements in technology for only cars</p>  <p>Pizza</p> <p>Cars</p>

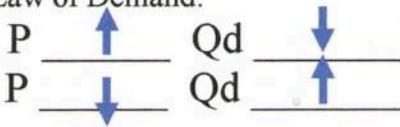

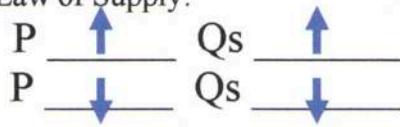

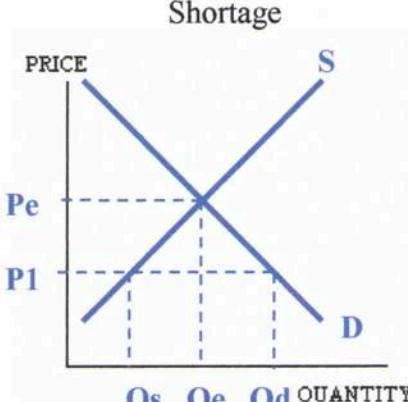

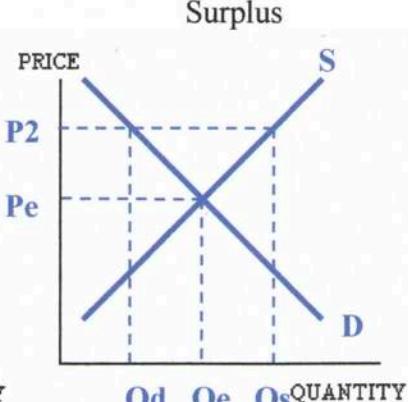

Trade: Absolute and Comparative Advantage*

	Sugar (tons)	Cars
Cuba	40 (1S costs $\frac{1}{4}$ Car)	10 (1C costs 4 Sugar)
Mexico	50 (1S costs 2 Cars)	100 (1C costs $\frac{1}{2}$ Sugar)

1. Which country has an absolute advantage in sugar? Mexico
2. Which country has an absolute advantage in cars? Mexico
3. What is Cuba's opportunity cost for producing one car? 4 Sugar
4. Which country has a comparative advantage in cars? Mexico
5. Which country has a comparative advantage in sugar? Cuba
6. For both countries to benefit from trade, how much sugar can be traded for each car? 1 Car for 1 Sugar (any number between 4 and $\frac{1}{2}$)

*See videos on YouTube channel ACDCLeadership

Demand*	Supply*	
The Law of Demand: 	The Law of Supply: 	
Why is demand downward sloping? 1. Substitution Effect- When price goes up, consumers buy more of a substitute product 2. Income Effect- If the price goes down for a product, the purchasing power increases for consumers -allowing them to purchase more 3. Law of Diminishing Marginal Utility- Since you eventually get less satisfaction from each new unit, the price must fall to increase quantity demanded	Why is supply upward sloping? 1. Opportunity Cost-At higher prices, profit seeking firms have an incentive to produce more. 2. Law of Diminishing Marginal Returns- Since the additional cost of each new unit will eventually increase, the firm must increase the price to increase quantity supplied.	
Changes in Quantity (Moving Along the Curve)		
What changes quantity demanded? Change in Price	What changes quantity supplied? Change in Price	
Changes in Demand and Supply (Shifting the Curve)		
What changes demand? (5 Shifters of Demand) 1. Tastes and Preferences 2. Number of Consumers 3. Price of Related Goods • Substitutes and Complements 4. Income • Normal and Inferior Goods 5. Future Expectations	What changes supply? (6 Shifters of Supply) 1. Prices/Availability of inputs (resources) 2. Number of Sellers 3. Technology 4. Government Action: Taxes & Subsidies 5. Opportunity Cost of Alternative Production 6. Expectations of Future Profit	
Substitutes : Price of A↑ Demand for B <u>↑</u> Price of A↓ Demand for B <u>↓</u>	Normal Goods: Income ↑ Demand <u>↑</u> Income ↓ Demand <u>↓</u>	
Complements: Price of A↑ Demand for B <u>↓</u> Price of A↓ Demand for B <u>↑</u>	Inferior Goods: Income ↑ Demand <u>↓</u> Income ↓ Demand <u>↑</u>	
Equilibrium and Disequilibrium*		
Shortage 	Surplus 	Equilibrium- $Q_d = Q_s$ Shortage- $Q_d > Q_s$ Surplus- $Q_d < Q_s$ Government Controls* Price FLOORS go <u>ABOVE</u> equilibrium and result in a <u>SURPLUS</u> . Price CEILINGS go <u>BELOW</u> equilibrium and result in a <u>SHORTG.</u>

*See videos on YouTube channel ACDCLeadership

Unit 2: Macro Measures

Measuring Growth

Definition of Gross Domestic Product (GDP)-
The dollar value of all final goods and services produced within a country's borders in one year.

$$\text{GDP} = \underline{\text{C}} + \underline{\text{I}} + \underline{\text{G}} + \underline{\text{Xn}}$$

Three things not included in GDP:

1. Intermediate goods- GDP includes only final goods (ex: price of finished car, not the radio, tires, etc.)
2. Non-production transactions including used goods or financial transactions. (ex: stocks, real estate, social security)
3. Non-market Activities- (ex: illegal production or labor)

Nominal GDP-

GDP measured in current prices. It does not account for inflation from year to year.

Real GDP-

GDP adjusted for inflation and expressed in constant, or unchanging, dollars

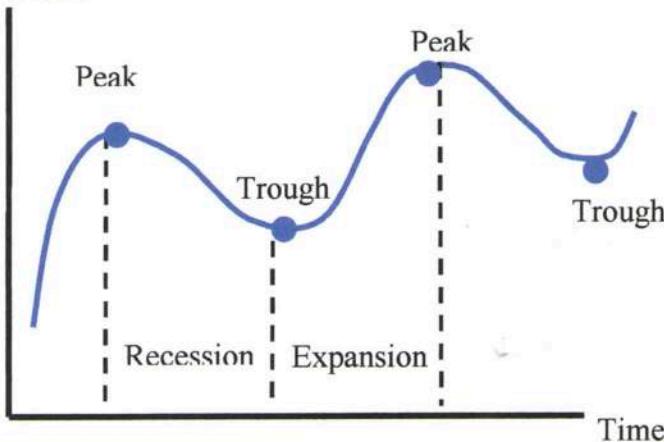

GDP Deflator- Measurement of inflation that is used to adjust (deflate) nominal GDP.

$$\text{GDP Deflator} = \frac{\text{Nominal GDP}}{\text{Real GDP}} \times 100$$

Business Cycle

Label peak, recession/contraction, trough, expansion

Real GDP

GDP Deflator Practice

1. The Nominal GDP is \$100 billion and the Real GDP is \$80 billion. Calculate the GDP deflator.
125 (prices are 25% higher since the base year)
2. The Real GDP is \$100 billion and the GDP deflator is 200. Calculate the Nominal GDP.
Nominal GDP = \$200 billion
3. The Real GDP is \$200 billion and the GDP deflator is 120. Calculate the Nominal GDP.
Nominal GDP = \$240 billion
4. The Nominal GDP is \$300 billion and the GDP deflator is 150. Calculate the Real GDP.
Real GDP = \$200 billion
5. The Nominal GDP is \$100 billion and the GDP deflator is 125. Calculate the Real GDP.
Real GDP = \$80 (same as question #1)

Measuring Unemployment*

1. **Frictional Unemployment:**
Temporarily unemployed or being between jobs.
Individuals are qualified workers with transferable skills but they aren't working.

2. **Structural Unemployment**
Changes in the structure of the labor force make some skills obsolete. Workers DO NOT have transferable skills and these jobs will never come back.

3. **Cyclical Unemployment**
Unemployment that results from economic downturns (recessions). As demand for goods and services falls, demand for labor falls and workers are fired.

Full Employment

Natural Rate of Unemployment (NRU)
Frictional and structural unemployment are unavoidable. Together they make up the natural rate of unemployment (or FULL EMPLOYMENT) which means NO Cyclical unemployment

Problems With Unemployment Rate

Discouraged Job Seekers-
People that are no longer looking for a job because they gave up. Since these people are not counted in the labor force, the unemployment rate may be too low.

Underemployed (part-time) Workers-

Someone who wants more hours but can't get them is still considered fully employed. The unemployment rate ignores the plight of such workers.

Measuring Inflation	CPI Practice*																				
Market Basket- A fix list of about 300 commonly purchased goods used to measure inflation over time.	Using the values of the market baskets below, calculate the CPI for each year. Start with 2009 as the base year then recalculate with 2010 as the base year. Lastly, recalculate with 2011 as the base year.																				
Consumer Price Index (CPI) Equation <u>Price of a market basket in a given year</u>	<table border="1"> <thead> <tr> <th>Year</th><th>Market Basket</th><th>Base Year 2009</th><th>Base Year 2010</th><th>Base year 2011</th></tr> </thead> <tbody> <tr> <td>2009</td><td>\$20</td><td>100</td><td>50</td><td>40</td></tr> <tr> <td>2010</td><td>\$40</td><td>200</td><td>100</td><td>80</td></tr> <tr> <td>2011</td><td>\$50</td><td>250</td><td>125</td><td>100</td></tr> </tbody> </table>	Year	Market Basket	Base Year 2009	Base Year 2010	Base year 2011	2009	\$20	100	50	40	2010	\$40	200	100	80	2011	\$50	250	125	100
Year	Market Basket	Base Year 2009	Base Year 2010	Base year 2011																	
2009	\$20	100	50	40																	
2010	\$40	200	100	80																	
2011	\$50	250	125	100																	
CPI = $\frac{\text{Price of the same basket in the base year}}{\text{Price of a market basket in a given year}} \times 100$																					
Helped or Hurt by Unexpected Inflation	Interest Rates and Inflation																				
Assume expected inflation is 2% but actual inflation turns out to be 5%. Who is helped and hurt by inflation?	Real interest rate= Real = nominal interest rate - expected inflation Nominal interest rate= Nominal = real interest rate + expected inflation 1. If the nominal interest rate is 7% and expected inflation is 3%, what is the real interest rate? 4% 2. If the real interest rate is -2% and the nominal interest rate was 3%, what was the inflation rate? 5%																				
Causes of Inflation	Quantity Theory of Money																				
1. The Government prints money to pay citizens and pay off debts (see the Quantity Theory of money) Usually causes hyperinflation. Examples: Bolivia, Peru, Brazil and Germany after WWI 2. Demand-Pull Inflation- An overheated economy with excessive spending but same amount of goods. ("too much money chasing to few goods") Example: If consumer demand increases, firms in the short-run, a large increase in demand will not lead to a large increase in 3. Cost-Push Inflation- The result of a "negative supply shock" that increases the costs of production and forces producers to increase prices. Example: A significant increase in the price of oil would lead to higher costs for firms and higher prices.	Quantity Theory of Money Equation: $M \times V = P \times Q$ M = Money Supply P = Price Level V = Velocity of Money Q = Quantity/Output The velocity of money is the average times a dollar is spent and re-spent in a year Assume the amount of money is \$5 and it is being used to buy 10 products with a price of \$2 each. 1. How much is the velocity of money? 4 2. If the velocity and output stay the same, what will happen if the amount of money increases to \$10? Price level will also double.

Unit 3: Aggregate Demand, Aggregate Supply, and Fiscal Policy

AD , AS, and LRAS*	Short Run vs. Long Run Aggregate Supply*
<p>Draw the economy at full employment</p> <p>Price Level</p> <p>LRAS</p> <p>AS</p> <p>AD</p> <p>PLe</p> <p>QFE</p> <p>Real GDP</p>	<ol style="list-style-type: none"> In the short run, wages and resource prices will NOT increase as price levels increase. In the long run, wages and resource prices will increase as price levels increase
<p>Shifters of AD and AS</p> <p>Shifters of Aggregate Demand</p> <ol style="list-style-type: none"> Consumer Spending Investment Spending Government Spending Net Exports <p>Shifters of Aggregate Supply</p> <ol style="list-style-type: none"> Inflationary Expectations Government Actions (taxes, subsidies, regulations) Resource Prices Productivity 	
<p>Recessionary Gap*</p> <p>Draw the economy in a recession</p> <p>Price Level</p> <p>LRAS</p> <p>AS</p> <p>AD</p> <p>PLe</p> <p>Qe</p> <p>QFE</p> <p>Real GDP</p>	<p>Inflationary Gap*</p> <p>Draw the economy beyond full employment</p> <p>Price Level</p> <p>LRAS</p> <p>AS</p> <p>AD</p> <p>PLe</p> <p>QFE</p> <p>Qe</p> <p>Real GDP</p>
<p>Classical vs. Keynesian*</p> <p>Draw and label the three ranges of the AS curve</p> <p>Price Level</p> <p>Classical</p> <p>Beyond full employment, short-run output cannot increase so prices must rise</p> <p>Intermediate</p> <p>Keynesian</p> <p>QFE</p> <p>Real GDP</p>	<p>Fiscal Policy</p> <p>Discretionary Fiscal Policy- Congress creates a new bill that is designed to change AD through government spending or taxation.</p> <p>Non-Discretionary Fiscal Policy- Permanent spending or taxation laws enacted to work counter cyclically to stabilize the economy</p> <p>Government Spending and Taxation</p> <p>Expansionary Fiscal Policy- Laws to increase output</p> <ol style="list-style-type: none"> Increase Government Spending Decrease Taxes (Increases disposable income) <p>Contractionary Fiscal Policy- Laws to reduce inflation</p> <ol style="list-style-type: none"> Decrease Government Spending Increase Taxes (Decreases disposable income)

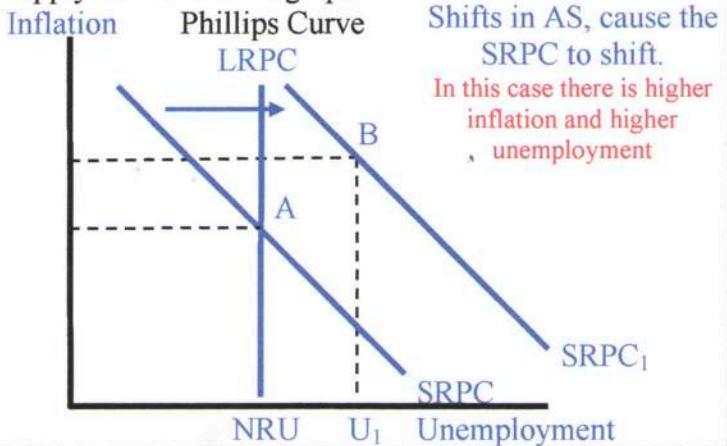

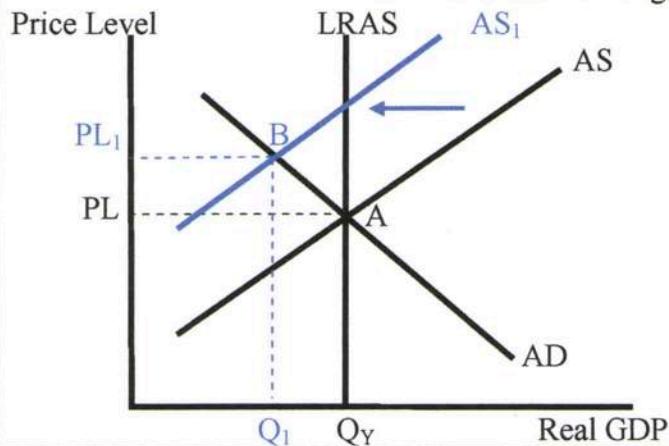

Short Run and Long Run Phillips Curve*

Draw and label the short and long run Phillips curve. Label points A, B, and C based on the changes in AD

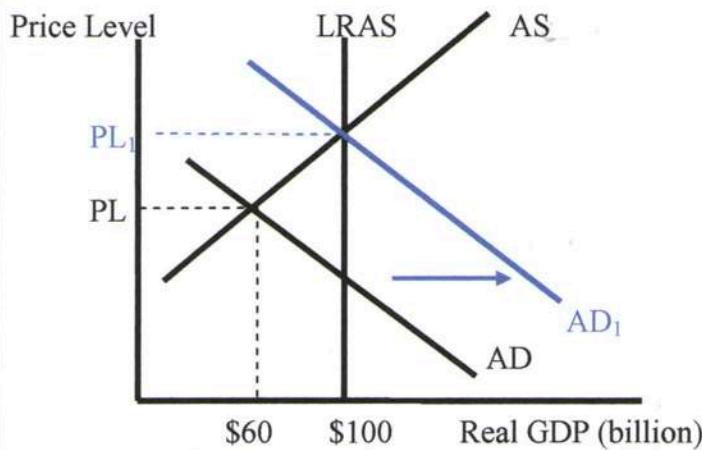

Draw and label the short and long run Phillips curve and label point A.

Show the result of a negative supply shock on both graphs

Spending Multiplier Practice*

1. What type of gap? Recessionary
2. To close the gap the government could increase spending or decrease taxes on consumers
Assume the MPC is .5: (multiplier is 2)
3. How much should the government increasing spending to close the gap? \$20 billion
4. How much should the government cut taxes to close the gap? \$40 billion (consumers only spend half)
Now assume that the MPC is .8: (multiplier is 5)
5. How much should the government increasing spending to close the gap? \$8 billion
6. How much should the government cut taxes to close the gap? \$10 billion (people save \$2B and spend \$8B)

Problem with Fiscal Policy

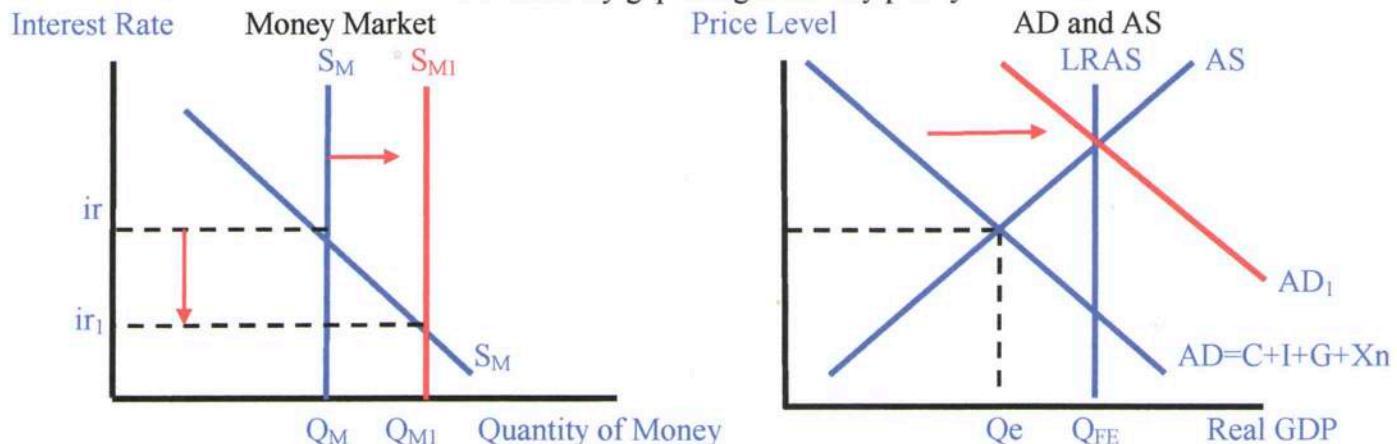

1. **Deficit Spending-**if the government increases spending without increasing taxes they will increase the annual deficit and the national debt
2. **Time Lags-**Congress takes time to write, debate, pass, and implement legislation
3. **Crowding out-** Government spending might cause unintended effects that weaken the impact of the policy. Ex: deficit spending to increase AD would increase interest rates and decrease investment

Unit 4: Money and Monetary Policy

Money Market*	Three Functions of Money
<p>Draw S&D of Money and Equilibrium Interest Rate</p> <p>Nominal Interest Rate Money Supply</p> <p>The FED is a government office that sets and adjusts the money supply to adjust the economy. This is called Monetary Policy</p> <p>Money Demand</p>	<ol style="list-style-type: none"> 1. A Medium of Exchange- Money can easily be used to buy goods and services with no complications of barter system. 2. A Unit of Account- Money measures the value of all goods and services. Money acts as a measurement of value. 3. A Store of Value-Money allows you to store purchasing power for the future.
	Types of Money
	<ol style="list-style-type: none"> 1. Commodity Money Something that performs the function of money and has alternative uses (ex: cigarettes in prison) 2. Fiat Money Something that serves as money but has no other important uses. (ex: \$20 dollar bill)
Shifters of Money Demand	Shifters of Money Supply (The FED)*
<ol style="list-style-type: none"> 1. Changes in price level- Inflation requires consumer to hold more cash for financial transactions. 2. Changes income- Sustained economic growth in the economy leads to more employment and increase in the demand for money 3. Changes in taxation that affects personal investment- Government policies such as changing the capital gains tax would change the demand for money 	<ol style="list-style-type: none"> 1. Reserve ratio-the percent of deposits that banks must hold in reserve (the % they can NOT loan out) <ul style="list-style-type: none"> -To increase money supply, decrease the reserve ratio -To decrease money supply, increase the reserve ratio 2. Discount Rate- the interest rate that the FED charges commercial banks <ul style="list-style-type: none"> -To increase money supply, decrease the discount rate -To decrease money supply, increase the discount rate 3. Open Market Operations- when the FED buys or sells government bonds (securities) <ul style="list-style-type: none"> -To increase money supply, the FED buys bonds -To decrease money supply, the FED sells bonds
Money Multiplier Practice*	Shifter Practice
<ol style="list-style-type: none"> 1. Assume the reserve requirement is .10. If the Fed buys \$10 billion worth of bonds the money supply will <u>increase</u> by <u>\$100</u> billion. 2. Assume the reserve requirement is .20. If the Fed sells \$10 billion worth of bonds the money supply will <u>decrease</u> by <u>\$50</u> billion. 3. Assume the reserve requirement is .10. If the Fed buys \$5 billion worth of bonds the money supply will <u>increase</u> by <u>\$50</u> billion. 4. Assume the reserve requirement is .50. If the Fed sells \$5 billion worth of bonds the money supply will <u>decrease</u> by <u>\$10</u> billion. 4. Assume the reserve requirement is .25. If the Fed sells \$2 billion worth of bonds the money supply will <u>decrease</u> by <u>\$8</u> billion. 	<ol style="list-style-type: none"> 1. If the FED increases the reserve requirement the money supply will <u>↓</u> and interest rates <u>↑</u>. 2. If the FED sells bonds the money supply will <u>↓</u> interest rates <u>↑</u>, and investment <u>↓</u>. 3. If the FED decreases the reserve requirement the money supply will <u>↑</u> and interest rates <u>↓</u>. 4. If the FED decreases the discount rate, the money supply will <u>↑</u> and interest rates <u>↓</u>. 5. If the FED buys bonds the money supply will <u>↑</u> interest rates <u>↓</u>, and investment <u>↑</u>.
	Federal Funds Rate
	<p>Federal Funds Rate- The federal funds rate is the interest rate that banks charge one another for one-day loans of reserves. The FED sets a target rate and using open market operation to hit the target.</p>

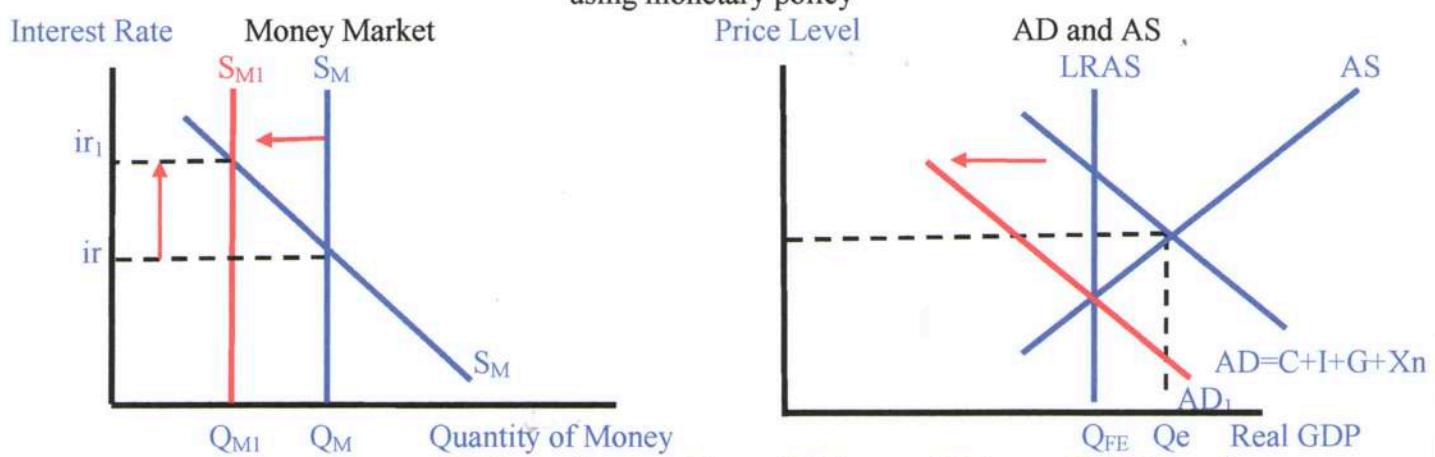

Monetary Policy and AD/AS*

Assume the country is in a recession. Use the money market graph to show how the FED closes the recessionary gap using monetary policy

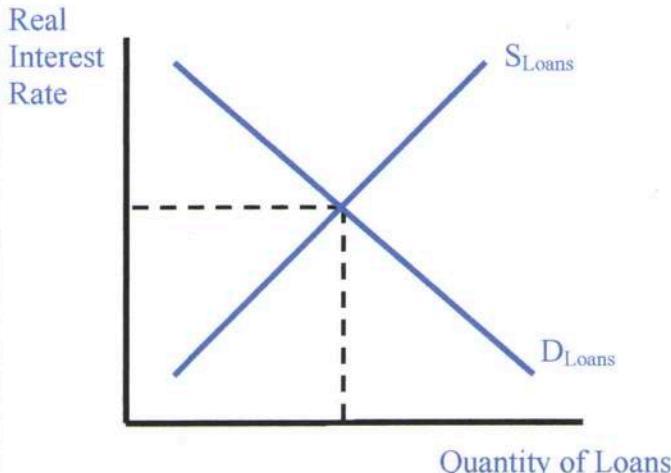

Use arrows to explain the process: $S_M \uparrow \rightarrow ir \downarrow \rightarrow I \uparrow$ and $C \uparrow \rightarrow AD \uparrow \rightarrow$ Full Employment

Assume an inflationary gap. Use the money market graph to show how the FED closes the inflationary gap using monetary policy

Use arrows to explain the process: $S_M \downarrow \rightarrow ir \uparrow \rightarrow I \downarrow$ and $C \downarrow \rightarrow AD \downarrow \rightarrow$ Full Employment

Loanable Funds

Shifters of Demand for Loanable Funds

1. Changes in perceived business opportunities
2. Changes in government borrowing

Shifters of Supply for Loanable Funds

1. Changes in private savings behavior
 2. Changes in public savings
 3. Changes in foreign personal investment
 4. Changes in expected profitability
1. What happens to the real interest rate if the government begins to deficit spend? Demand for loans increases so interest rate increases
 2. If lenders decide to lend less, real interest rates \uparrow , investment \downarrow , and economic growth \downarrow

Unit 5: International Trade

Key Terms	Balance of Payments
<p>Export- the sale of goods and service created by domestic producers to foreign consumers.</p> <p>Import- the purchase of goods and service created by foreign producers to domestic consumers.</p> <p>Net Exports (X_N)- Exports – Imports. The difference between a nation's exports of goods and services and its imports of goods and services</p> <p>Trade Deficit- Exporting less than is imported (aka.trade gap) The US has a huge trade deficit with China.</p> <p>Trade Surplus-Exporting more than is imported. China has a huge trade surplus with the US.</p>	<p>Balance of Payments- summary of all international transactions within a given year prepared in the domestic country's currency</p> <p>Current Account- The sum of trades in goods and services, investment income, and net transfer payments</p> <p>Examples:</p> <ul style="list-style-type: none"> -Toys imported from China -Dividends paid to foreign investors -Foreign aid <p>Capital Account- The net change in national ownership of assets</p> <p>Examples:</p> <ul style="list-style-type: none"> -US company buys a hotel in Russia -German investor buys \$5000 US Treasury Bonds
Foreign Exchange (FOREX)	FOREX Shifters*
<p>Appreciation- The US dollar will appreciate relative to another currency if demand for the dollar <u>increases</u> or if supply <u>decreases</u>. This will cause US exports to <u>decrease</u> and imports to <u>increase</u> .</p> <p>Depreciation- The US dollar will depreciate relative to another currency if demand for the dollar <u>decreases</u> or if supply <u>increases</u>. This will cause US exports to <u>increase</u> and imports to <u>decrease</u> .</p>	<ol style="list-style-type: none"> 1. Changes in Tastes- Ex: British tourists flock to the U.S 2. Changes in Relative Incomes (Resulting in more imports)- Ex: US growth increase US incomes 3. Changes in Relative Price Level (Resulting in more imports)- Ex: US prices increase relative to Britain 4. Changes in relative Interest Rates- Ex: US has a higher interest rate than Britain.
Foreign Exchange Market*	Appreciation and Depreciation*
<p>Draw the foreign exchange market for Mexican Pesos. Show what happens to the value of pesos relative to the US dollar if interest rates in Mexico are higher</p> <p>\$/Peso</p> <p>US citizens want more Mexican financial assets (bonds) and demand more pesos. The peso appreciates</p>	<ol style="list-style-type: none"> 1. If American tourists increase visits to Japan, the supply of US dollars will <u>increase</u> and the demand for Japanese yen will <u>increase</u>. The dollar will <u>depreciate</u> and the yen will <u>appreciate</u>. 2. If the US government significantly decreases personal income taxes, the dollar will <u>depreciate</u> and the yen will <u>appreciate</u> 3. If inflation in the Japan rises significantly faster than in the US, the dollar will <u>appreciate</u> and the yen will <u>depreciate</u> 4. If Japan has a large budget deficit that increases Japanese interest rates, the dollar will <u>depreciate</u> and the yen will <u>appreciate</u> 5. If Japan places high tariffs on all US imports, the dollar will <u>depreciate</u> and the yen will <u>appreciate</u> 6. The US suffers a larger recession the dollar will <u>appreciate</u> and the yen will <u>depreciate</u>
